ABOUT

Backend Lead with 4+ years in production. I build transactional systems — payments, identity, bookings — from scratch, with a focus on scalability, security, and reliability that holds up as the business grows. I care about correct state transitions, explicit trust boundaries, and API contracts that don't break under real-world conditions. Open to remote backend roles.

WORK EXPERIENCE

Backend Lead — PatagoniaDreams.com.ar

Jul 2024 – Present · Remote, Argentina

Built the backend from scratch for a tourism operator with **180k+ passengers/year** and **7,000+ five-star Google reviews**. Designed the full business model over Django/Python and PostgreSQL, with a focus on scalability and production security.

- Designed transactional payment flows (Mercado Pago, Stripe, Pix) using webhooks as the single source of truth for payment confirmation, with HMAC validation and idempotency by event_id.
- Implemented bidirectional sync with an external activity panel: real-time availability and pricing pulled in before each booking; confirmed reservations automatically injected back into the panel via API.
- Built the full business model: activity and hotel bookings, dynamic pricing, promotions, coupons, and a multi-tenant backoffice for partners and end customers.
- Integrated Google (OAuth 2.0, My Business API, Merchant Center), Meta, Watti, and Amazon SES for automations, review management, product feeds, and transactional email.
- Development follows a structured flow: feature branches → CI checks (linting, security scans) → PR review → merge to production. No direct pushes to the production branch.

Backend Developer — Municipality of Bahía Blanca

Mar 2022 – Jun 2024 · On-site, Argentina

Designed and built **autentica.bahia.gob.ar** — the centralized SSO-style identity gateway for Mi Bahía, the citizen authentication platform of Bahía Blanca.

- Centralized access to 10+ critical municipal services under a single identity layer. ~15k logins/month, 2 years uninterrupted in production.
- Integrated national identity providers: ARCA, ANSES, RENAPER, and Mi Argentina. The gateway is the sole component that calls those APIs and the sole issuer of session tokens.
- JWT + OAuth2 architecture with minimal claims in tokens (no PII); downstream legacy services validate tokens and apply RBAC only — they never re-authenticate.
- Fail-safe by design: never issues a verified session when national APIs are unavailable. Degraded mode with explicit rejection instead of relaxing the rule.
- Audit logging on sensitive paths; RBAC enforced at gateway (route-level) and at service layer (resource-level).

Side Projects — Personal Tools & Experiments

2020 – Present

Personal collection of tools built around real interests: crypto market analysis with AI, trading card collection management, poker hand review. Stack: Python, FastAPI, Streamlit, Pandas, Plotly, Transformers, OpenAI APIs. Space to experiment freely with libraries outside the enterprise stack.

TECHNICAL SKILLS

Core	Python · Django · Django REST Framework · PostgreSQL
Cloud & Infra (complementary)	AWS (Cognito, SES, Secrets Manager, ECR/K8s) · Docker · GitHub Actions
Payments	Mercado Pago · Stripe · Pix (HMAC validation · idempotency patterns)

Integrations

Google (OAuth 2.0, My Business, Merchant Center) · Meta · ARCA · ANSES · RENAPER · Mi Argentina · Amazon SES

EDUCATION

Tecnicatura Superior en Computación — Universidad Nacional del Sur

2022 – Present (in progress)

Most of my skills come from hands-on production work and self-learning. 4+ years of professional experience building real systems — backend APIs, payment flows, identity gateways, and third-party integrations.

LANGUAGES

Spanish: Native English: Conversational — strong reading and listening comprehension
